nutritional blood microscopy Dr. Thomas Brewer

Are you really as healthy as you look and feel? **Now you can find out in as little as thirty minutes.** Utilizing a technique known as 'Nutritional Blood Microscopy,' Dr. Thomas Brewer will view and analyze a single drop of blood from your fingertip using a darkfield microscope. The images are displayed live on a video monitor for you to see, and you will even receive a dvd (video and audio) of the entire experience, all for $90. This unique blood analysis will reveal:

- how well you are digesting proteins and fats
- whether oxidized forms of cholesterol, plaque, or uric acid have formed crystals
- the relative strength and activity of your immune system
- whether your blood contains bacterial parasites
- whether your blood contains fungal forms such as yeast
- free radical damaged red blood cells
- vitamin or iron deficiencies
- hormonal system imbalance
- if your body is recovering well from illness or a hard physical workout

In general, we consume food so that we can extract the nutrients through digestion. Yet if our bodies cannot digest, metabolize, and eliminate a food source in ten hours or less, that meal contributes to toxicity, disease, and illness. Dr. Brewer has found that over 90% of the people he has analyzed were 'not' as healthy as they thought they were. Many were developing potentially deadly conditions in their bodies without feeling anything negative or even knowing that something was wrong. However, the precursors can be **visually** detected in one's blood during an individual blood analysis.
